Day 1 | Classwork

Exercise 1

Print your name in an h1 HTML element using PHP (define the variable and store your name into it). Use external CSS to position your name in the middle of the screen (horizontal, vertical).

Exercise 2

Create an if statement which will be based on the current day. Output a message - if it is Monday it will return: "Happy Monday!" If it is not a Monday it should return: "Have a nice day!"

Exercise 3

Create an else if statment which will be based on the current day. Output a message - if it is Monday, it will return: "Today is Monday!" if it is Tuesday, it will return: "Today is Tuesday!" etc. for every day in the week.

Exercise 4

Create a **for** loop which will print your name 50 times on the screen. Do the same with **while** and **do while** loop.

Exercise 5

Define an numeric array with 10 elements. Use a **foreach** loop to output the value of every array's element.

Exercise 6

Define an associative array and output array elements on the screen. Use for this cartoon/anime/game characters (like Mickey Mouse, Super Mario, Goku, Pokemon etc.).

Transform this code into a solution done with multidimensional arrays to track different properties of the characters. (hint: remember the logic used for the automated creation of HTML)
